LONG ISLAND OFFICE

COMPLAINT

BIANCO, J.

v.

WALL, M.J.

DARPA,   Defendants,

I request a COURT ORDER ordering the release of all requested information from the Defense

Advance Research Projects Agency DARPA at 3701 N. Fairfax dr., Arlington, VA 22203. I have made two

Request to them exhibits X - Y and proof of service exhibit Z - ZZ. This agency holds a lot

Of the proof of the existence of the technology that reads our thoughts (FMRI technology). I have

Heard nothing from them and need this information to further prove the existence of violations of

Our constitution.

Oct. 22, 2009

This request is made under the Freedom of Information Act and/ or Privacy Act of 1974. My request should be made free of charge because of the public interest; but if you can not make it free of charge I will be happy to pay for it; after being cleared by me. My request is as follows:

1. I request information on FMRI technology. (functional magnetic resonance imaging)
2. The date it was perfected (FMRI technology)
3. The first report on the first person it was used against successfully. (FMRI technology)
4. A present list of all agencies presently using FMRI technology FBI, CIA, NSA, NRO etc. etc.

THANK YOU,

/ 0 - 2 2 · 0 9

Nov. 30, 2009

To Whom It May Concern:

I have made a Freedom of Information Act request to your agency. I have not received any response

As of yet. Attached you shall find a copy of my request. If I do not hear from you soon; I must seek

Action in federal court.

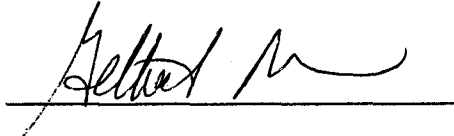

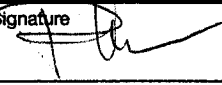

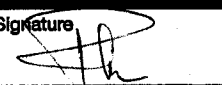

Respectfully Submitted,

_____

Neurotechnology for Intelligence Analysts

Program Manager: Dr. Amy Kruse

THRUST AREA

Training and Human Effectiveness

The vision for the Neurotechnology for Intelligence Analysts (NIA) Program is to revolutionize the way that analysts handle intelligence imagery, increasing both the throughput of imagery to the analyst and overall accuracy of the assessments. Current computer-based target detection capabilities cannot process vast volumes of imagery with the speed, flexibility, and precision of the human visual system. Investigations of visual neuroscience mechanisms have indicated that the human brain is capable of responding to visually salient objects significantly faster than an individual's visual-motor, transformation-based (i.e., movement) response.

The NIA Program seeks to identify robust brain signals that are amenable to recording in an operational environment and process these in real time to select images worthy of further review. The program aims ultimately to apply these triage methods to static, broad-area, and video imagery. Successful development of a neurobiologically based image triage system will increase the speed and accuracy of image analysis in a context where the number of acquired images is expected to rise significantly. In sum, the results of the NIA Program will enable image analysts to train more effectively and process imagery with greater speed and precision.
